8-bit static shift register

HEF4014B  
MSI

DESCRIPTION

The HEF4014B is a fully synchronous edge-triggered 8-bit static shift register with eight synchronous parallel inputs (P<sub>0</sub> to P<sub>7</sub>), a synchronous serial data input (D<sub>S</sub>), a synchronous parallel enable input (PE), a LOW to HIGH edge-triggered clock input (CP) and buffered parallel outputs from the last three stages (O<sub>5</sub> to O<sub>7</sub>).

Operation is synchronous and the device is edge-triggered on the LOW to HIGH transition of CP. Each register stage is of a D-type master-slave flip-flop. When PE is HIGH, data is loaded into the register from P<sub>0</sub> to P<sub>7</sub> on the LOW to HIGH transition of CP. When PE is LOW, data is shifted to the first position from D<sub>S</sub>, and all the data in the register is shifted one position to the right on the LOW to HIGH transition of CP. Schmitt-trigger action in the clock input makes the circuit highly tolerant to slower clock rise and fall times
